'By 2019, we want to ensure every house in this country gets power'

BY LATHA VENKATESH CNBC-TV18

ndia has moved on from being a nation of power shortages to one that is grappling with power surplus, minister of state with independent charge for power. coal, new and renewable energy and mines Piyush Goyal said. In an interview on the third anniversary of the Narendra Modi government, Goyal said given the power surplus, the tariff policy may need to be relooked. Edited excerpts:

To look at the record of the last three years, what would you say is the seminal achievement of your own ministry?

The big picture is that a country which was accustomed to shortages is today grappling with the problem of surplus. That change of mindset has completely changed the way policy is made, the way companies are planning their investments.

I was recently telling my colleagues that the entire tariff policy also needs to be relooked in this new scenario.

Coal linkages in the earlier days were a prized possession. Today we have made it so transparent that everybody has an equal opportunity to bid and get a coal linkage of his choice, where he saves money on transportation. It is an efficient way of utilising coal. I see the records every day and I worry for the fact that India over the years could not imagine being self-sufficient in coal.

Therefore, we have set up 83100 megawatt of thermal on imported coal or imported blends of coal because of which Coal India today can produce much larger quantities, India could be domestically self-reliant at least for thermal coal. We are helplessly importing coal to feed these plants.

Now this despondency of the past turning into a sense of optimism, self-reliance, India on its own feet, energy secure, that I think is the biggest story as far as the power and coal sector go.

What would you say is the agenda for the next two years?

Prime Minister Narendra Modi believes that we have to take power to every household in this country. Every child deprived of power, 70 years after independence is a matter of shame for this country, collectively.

We have set a deadline of 15 August 2022 by when we want to ensure that everybody gets access to

affordable and good quality power.

On a personal note, we will make sure that the villages get electricity by the end of this year. We will make sure that every household in the 18,452 villages, the target Prime Minister Modi has set for 1,000 days, will within those 1,000 days not only have power reach them but every household in these 18,452 villages will have electricity. I am trying to advance the target of 2022 as much as possible. Hopefully, by 2019 about 2.5 years from now we want to ensure that every house in this country gets power either through the grid or through capacity which is largely based off-grid solutions, which also

Minister of state with independent charge for power, coal, new and renewable energy and mines HINDUSTAN TIMES Piyush Goyal.

we are employing in a large way.

While coal is not a bottleneck anymore, the big bottleneck is still demand. We have not heard of a PPA in a long time or at least a substantial amount of

INTERVIEW **PPA. You have** brought the DISCOM debt considerably down because of **UDAY but they are still** not surplus enough to put out PPAs. How do you solve that problem?

> There are three aspects to your question, first of all 'yeh dil maange more'. I am delighted that it is yeh dil maange more. Even a beggar doesn't go to anybody unless he believes that he can give him something. So, it is a great thumbs-up for the trust that the people of India have in Prime Minister Modi and his government. The fact that they believe if there is somebody who can transform their lives, if there is somebody who

can meet the aspirations of a billion people, it is Prime Minister Modi. With his commitment, with his zeal to serve the poor, the farmers, rural India, the people know that he is the man who can take this country to the next level.

As regards to the second question of demand, I think you need to get the right perspective to the people of India. In the first place, the demand in power sector has grown 6.5% from the established power infrastructure, all three years. The CAGR is about 6.5%

In the last 10 years when the UPA Congress was in power, the growth was 6.16% CAGR and the so called boom years also included. So, the demand has not slowed down at all.

The thrust on energy efficiency, which the Modi government has brought in was never there in the country or in fact in the world before. The kind of huge rollout on LEDs, on tubelights, on fans, on better air conditioning systems, the fact that we are working with agricultural pumps becoming more energy efficient, my next programme is going to roll out around motors with new DC Brushless Motors. A rough assessment indicates that when we will turn 100% LED by 2019 or so, and the pace is rapid, we will be saving about 112 billion units of electricity annually. My consumers in India will save Rs40,000 crore in electricity bills every year.

If you put that in perspective of energy demand, it would have added another 3%. So, if we had not done this big savings for the consumers, energy demand would have been 9.5%. I would lastly like to submit that captive power is still not captured in all this.

If you recall earlier, captive power plants were all starving for coal. Today they are all surplus, flush with coal. Captive power generation was not being captured in the past. I have asked my office to have a look at that but I would not be will by next year be making a profit.

Rajasthan which was also making about Rsl5,000 crore loss during the Ashok Gehlot regime when they had messed up the entire power infrastructure, Vasundhara Raje Scindia has been working steadfastly and I believe they will have halved their losses this year. By next year we are quite hopeful that that state will also break even. Haryana has two discoms, one has turned into profit, the other we are working on, Uttar Pradesh was in a very bad state of flux.

surprised if that power genera-

tion has grown by leaps and

bounds in the last three years.

In terms of the PPAs, with

this kind of demand and in the

peak summer, this has been

one of the worst summers. You

have not heard of any power

outages anywhere in the coun-

try. Delhi is a little bit of an

exception more because the

Delhi government failed to

create the enabling infrastruc-

ture to meet this high demand.

we were handling the Delhi

government before November

2014, in which period recog-

nising the problems of Delhi

and you recall my baptism by

storm, my early days as power

minister, we drew up a

Rs7,000 crore programme to

upgrade the Delhi infrastruc-

ture to meet this growing

demand particularly in peak

Sadly the new government

that was elected failed to

implement that programme. I

had meetings with them, I had

meetings with the power min-

ister and his officials, and they

said we believe we don't need

That is really the prob-

lem, state governments

are not going behind dis-

coms, ensuring them to

be financially well

equipped to go out and

put PPAs. It is not as if

India doesn't have a

Not all the state govern-

Have you seen some of

the discoms becoming

financially profitable?

Yes. I met the power minis-

ter of Tamil Nadu recently and

he said that a state which was

making Rs15,000 crore loss

ments, there may be a few

to invest this money.

powerneed.

which ...

months.

We had a small tenure when

Yogi Adityanath has taken this up as a mission to take power to every home, to strengthen the power infrastructure, to eliminate corruption in his state. I may have had about 12 or 13 interactions in less than two months with Chief Minister of UP.

needs, what the shortages are, have caused this distress. There was a small shortage and you had 100,000 megawatt of capacity being created. Today all of that stress is

because of surplus capacity. You will have to admit there are two issues where there is need for power. Our annual consumption level is about 1000 kilowatt hours (kWh). China is 4000 kWh. developed countries are 15000 kWh. So, clearly there is a bit of a catch-up in terms of demand and discoms are not giving PPAs.

I will tell you the number of power plants that are operating at less than 50 percent PLF in thermal. GMR, GVK, Adani, Reliance Power, everybody will tell you that they have some plants which are operating at 50-60 PLF for want of PPA.

This has gone to prove that Prime Minister's decision to scrap the Planning Commission was correct. After all the figures that the Planning Commission used to come out with in terms of what the country

fuelled by the large manufacturing bases that they had setup. Second, India's per capita income is one fifth or one fourth of China. So, your perspective of looking at it is entirely wrong.

India's growth can be juxtaposed to its own economic growth and the growth in power demand can go in tandem with that. I would aspire to have 4000 kW certainly but not tomorrow, there is a trajec-

The problem is that there are these power plants which are not operating to capacity.

Obviously they won't. If the denominator goes up very significantly, irrationally-by the way I could have let all of these plants remained stressed and stalled, the banking system would have collapsed. So, rather than that we have tried to get all of them into operation, get them to operate even if the whole plant load factor of the nation falls because we are still meeting energy needs. We have Vidyut Pravah as an app which gives you real-time data. Yesterday while I was sitting with the owner of a very large newspaper chain, I looked up the Vidyut Pravah app and I was a little sad that the price has gone up to Rs3.82 per unit. So, this is the stage where India has come where at Rs3.82 per unit the power minister is worried that why has it gone beyond Rs3.50 per unit as against Tamil Nadu, Kerala, Telangana and at times UP also buying power at Rsll-12 per unit.

Are you seeing the discoms put out any PPAs because that is the hunger for the banks also.

Nobody will put out a PPA unless there is a need for a PPA. There were irrational amounts of PPAs signed in the past which are now coming into use and people are buying power out of that. I can't force states to have a PPA to solve a problem of a private generator when he has set it up without a PPA on a calculation which China's demand largely is | was flawed in the first place.
